Multimode fiber distance attenuation

Overview

Fiber Optic Transmission Distance: Single Mode vs. Multimode GuideFiber optic transmission distance is influenced by the operating wavelength, with common.

Key Takeaways

Multimode fiber is designed for short-distance transmission, with maximum distances ranging from tens of meters to around 2 km depending on fiber type and data rate.

Attenuation and Modal Dispersion

Multimode fiber experiences attenuation, which is the reduction of light signal power as it travels through the fiber. Attenuation is caused by intrinsic losses like Rayleigh scattering, absorption, impurities, bending, and connector losses. In multimode fiber, modal dispersion—the spreading of light pulses due to multiple propagation paths—is the primary factor limiting distance rather than attenuation alone.

This is because different light modes arrive at the receiver at slightly different times, causing signal overlap and limiting the maximum bit rate over distance. Distance Limits by Fiber Type and Data RateMultimode fibers are classified as OM1, OM2, OM3, OM4, and OM5, with increasing bandwidth and performance: OM1 (62. 5 µm core): Typically supports 1 Gbps up to 275 meters and 10 Gbps up to 33 meters.

OM2 (50 µm core): Supports 1 Gbps up to 550 meters and 10 Gbps up to 82 meters; under optimal conditions, 1 Gbps can reach 2 km. OM3 (50 µm, laser-optimized): Supports 10 Gbps up to 300–400 meters, 40G/100G up to 100 meters. OM4 (50 µm, higher modal bandwidth): Supports 10 Gbps up to 400 meters, 25G up to 100 meters, 40G up to 150 meters, and 100G up to 100 meters.

OM5 (wideband multimode): Optimized for short-wavelength division multiplexing (SWDM), supporting similar distances as OM4 for standard Ethernet speeds but enabling multi-wavelength applications. Practical ConsiderationsShort-range applications: Multimode fiber is ideal for in-building, data center, or campus networks where distances are typically under 500 meters. Longer distances: For backbone or cross-building links exceeding 500 meters, single-mode fiber is preferred due to lower attenuation and absence of modal dispersion.

Connector and splice quality: Each connector or splice introduces additional loss, so high-quality, low-loss components are essential to maintain signal integrity over the maximum distance. Data rate impact: Doubling the data rate roughly halves the maximum distance due to increased modal dispersion.

Summary

Multimode fiber is limited by modal dispersion and attenuation, making it suitable for short- to medium-range links. The maximum distance depends on fiber type, data rate, and installation quality, with OM4 and OM5 fibers providing the longest reach for high-speed Ethernet within buildings or data centers. For distances beyond 2 km or high-speed backbone links, single-mode fiber is recommended.
