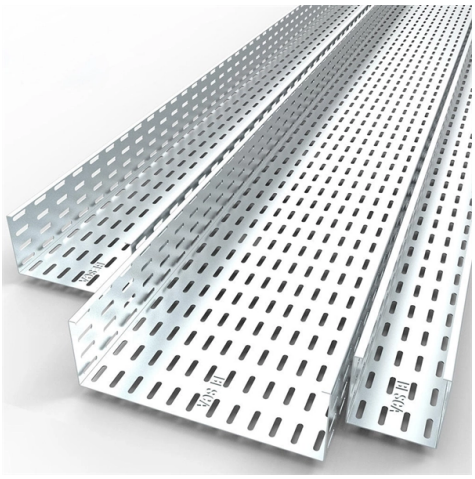
# Can optical modules be installed in desktop computers



## Overview

The most secure solution is to install a fiber NIC (Network Interface Card) into the PCI slot of a desktop computer. The NIC has a fixed optical connector or an SFP slot where different modules can be used to support speeds from 100M to 10 Gigabit. Most computers are not equipped with the necessary hardware to interface directly with fiber optic cables. SFP and other optical modules are key components of any fibre optic network. It's essential to understand how to properly install and configure an SFP. It requires a fiber switch in the telecom room, a fiber optic cable run to a wall plate or floor box near the desktop, and a connection from your desktop's fiber optic network interface card (NIC). Note that the switch above is powered via PoE and would also need SFP+ transceivers. However, it has some pretty nifty features! A fiber network adapter allows you to. Among these devices, optical devices such as CD, DVD, or Blu-ray drives are often required for tasks like data backup, software installation, and multimedia playback.
