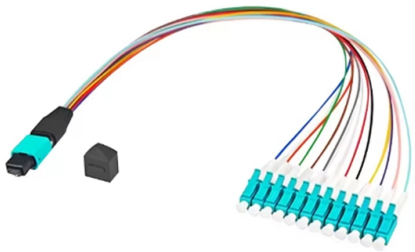
Can the network speed be set on an aggregation switch



Overview

Specify the link speed for the aggregated Ethernet links. 3ad link aggregation enables you to group Ethernet interfaces to form a single link layer interface, also known as a link aggregation group (LAG) or bundle. In an aggregate link, traffic is distributed across the member ports. This article details the process of how to change aggregated link speed safely and efficiently, covering necessary steps and. For maximum throughput in gateway-to-aggregation switch connections, it is recommended to use SFP+. What is the difference between static LAG configurations and LACP?

Static LAG (Link Aggregation Group) Configurations: These require manual configuration on both ends of the link, which can be prone. This document explains how to configure LAG on a switch through the Command Line Interface (CLI).
