Data Center PCD Trip Emergency Plan

Overview

This strategy is com-posed of 7 elements arranged across 3 categories: Emergency Response Procedures, Emergency Drills, and Incident Management. The paper describes each element and offers practical advice to assist in implementing this strategy. The objective is to create an Event Classification System for large data centers to effectively respond to different types of events. By classifying scenarios as green, yellow, or red, the response team can be better prepared and have clear expectations regarding the required response. Establish an Event. Key components of a recovery plan include defining Recovery Time and Point Objectives (RTO & RPO), conducting Business Impact Analyses, and establishing clear communication strategies. If a power outage occurs, continued operation depends on information that is stored on cards, tapes, or disks, and the equipment that is used to process the information that is available. In line with the principle of “safety first, prevention-oriented, and comprehensive management,” this emergency response guide focuses on fast and accurate handling of emergencies in Distributed Control Systems (DCS) and Programmable Logic Controllers (PLC).
