Do optical modules belong to IDC

Overview

IDC InfoBrief A coherent optical module refers to a typically hot-pluggable coherent optical transceiver that uses coherent modulation and is normally used.

Key Takeaways

Optical modules in IDCs are critical components enabling high-speed, low-latency, and scalable data transmission within modern data centers.

Overview

Optical modules are devices that convert electrical signals into optical signals and vice versa, facilitating high-speed data transfer across fiber optic networks in Internet Data Centers (IDCs). They are essential for connecting servers, switches, and storage systems, supporting internal data flows, and enabling efficient network architectures such as Leaf-Spine and flat topologies.

Types and Speeds

Modern ID

Cs use a variety of optical modules based on speed and application: Short-reach modules: Typically 100G, 200G, or 400G, used for intra-rack or intra-data center connections. Long-reach and coherent modules: Support 400G, 800G, and beyond, suitable for inter-data center links and disaster recovery. Parallel optical modules: Combine multiple fibers or wavelength-division multiplexing channels to increase bandwidth density and reduce cable complexity.

Emerging high-speed modules: 1. 6T pluggable optics and co-packaged optics (CPO) are being developed for AI-scale and hyperscale data centers, offering higher bandwidth and improved power efficiency. Key TechnologiesLPO (Linear-drive Pluggable Optics): Reduces power consumption and latency by removing DSPs, suitable for closed-system AI deployments.

NP

O (Near-Packaged Optics): Places optical engines close to xPU chips, improving signal integrity and bandwidth while maintaining thermal separation.

CP

O (Co-Packaged Optics): Integrates optical engines directly with processing units for ultra-high-speed, low-latency connections, ideal for hyperscale AI clusters. Applications in IDCsOptical modules are used for: Internal interconnects: High-speed links between servers, switches, and storage within the data center. Traffic diversion and metro network interconnection: Ensuring reliable, low-latency routing and redundancy.

A

I and hyperscale computing: Supporting massive east-west traffic in GPU clusters with 800G modules for high bisection bandwidth. Data security and disaster recovery: Coherent modules enable long-distance, high-capacity transmission for backup and replication.

Market Trends

The optical module market is growing rapidly due to cloud computing, AI, 5G, and big data demands. Key trends include: Rapid adoption of 400G and 800G modules, with 1. 6T modules emerging.

Increasing use of silicon photonics and co-packaged optics for higher efficiency and lower power consumption. Expansion of parallel optical modules to meet high-density, high-bandwidth requirements. Continuous upgrades in data center speeds, with 100G ports evolving to 400G and beyond in just a few years.

Conclusion

Optical modules are foundational to IDC performance, enabling scalable, high-speed, and low-latency data transmission. Advances in module technology, including LPO, NPO, CPO, and high-speed coherent optics, are driving the evolution of modern data centers, particularly for AI, hyperscale, and cloud computing applications.
