Deploying ports on multiple core switches

Overview

Use 2 ports on each of “top” and “bottom” switches of the stack for uplink connectivity and redundancy. RJ45 ports serve access-layer copper connections; SFP/SFP+ ports enable flexible 1G/10G uplinks; SFP28 delivers 25G for modern data centers; QSFP+ and QSFP28 support high-density 40G/100G spine–leaf. This deployment guide shows how to use multiple tiers of MCLAGs to provide link and switch redundancy in a large campus. This guide is intended for network and security architects and engineers who are interested in deploying Fortinet's FortiSwitch units in a new environment or in replacing their. Supported: Peering Over an Orphan Device with Both the vPC Peers. Supported: Peering Over a vPC Interconnection Where Each Nexus Device Peers with Two vPC Figure 70. To establish a VSX relationship between the core switches, create a link aggregation (LAG) interface for assignment as the VSX data. Each series of switches has different models based on the number of uplink ports, number of downlink ports, and whether cards are supported. For example, among the S5730HI, an S5730-36C-HI has 24 downlink ports, while an S5730-60C-HI has 48 downlink ports. If there are a large number of access. It is recommended to keep the total switch port count in a network to fewer than 8000 ports for reliable loading of the switch port page. Use L3 interfaces only for data VLANs.
