Fiber Bragg Grating Detection Unit

Overview

An optical interrogator, also known as measurement unit or data acquisition system, is an optoelectronic instrument, which allows the reading of optical fiber Bragg grating (FBG) sensors in static and dynamic monitoring applications. An FBG Sensing System comprises three discrete sub-systems: i) A network of fibre Bragg grating sensors or transducers embedded within or attached to the structure being monitored ii) An FBG Interrogator, an optoelectronic unit which illuminates the sensor network and records the optical reflection. Optical interrogators specifically designed to measure the values generated by Fiber Bragg Grating (FBG) sensors. This review provides a comprehensive overview of FBG sensor technology. The Fiber Bragg Grating (FBG) sensor is very high sensitive and versatile optical device for measuring several physical parameters including for example: strain, temperature, pressure, vibration and displacement. on different points on the same sensor cable.

A fiber Bragg grating (FBG) is a type of distributed Bragg reflector constructed in a short segment of optical fiber that reflects particular wavelengths of light and transmits all others. This is achieved by creating a periodic variation in the refractive index of the fiber core, which generates a wavelength-specific dielectric mirror. Hence a fiber Bragg grating can be used as an inline optical filter to block certain wavelengths, can be use
