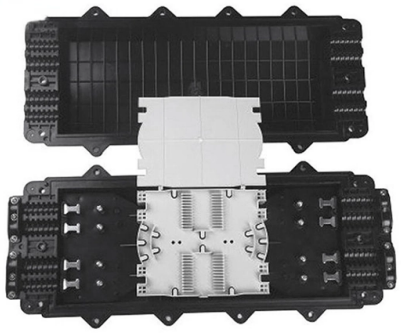
Does the access switch have a ring network



Overview

A fiber optic ring network is a physical or logical network topology where devices (usually switches) are connected in a closed-loop using fiber optic cables. Each node is connected to two other nodes, forming a ring-like structure. Rings can be unidirectional, with all traffic. The IE 3100 and IE 2000 switches selected in the Johnson Controls® catalog as access switches can be configured to manage rings using Media Redundancy Protocol (MRP). A ring topology improves network availability. Does anybody have any experience or recommended design guidelines which can be referred. The access layer is where endpoints (such as phones, laptops, video-conferencing sets, printers, IoT sensors, IP cameras, and servers) are primarily connecting to the network. FortiSwitch units distribute the ports to plugs. The other name for “ring” is cascading where core connects to switch-A, which connects to switch-b, to switch-c. is switch-A fails, it may cause failures or disruptions to other switches. This design ensures data can travel in both directions.
