Gigabit Optical Module Installation Mode

Overview

Installation and Maintenance Guide for Gigabit Optical Modules and 10. Inserting and Removing Optical Modules: When inserting or removing optical modules.

Key Takeaways

Proper installation of a Gigabit optical module involves confirming interface type, handling with ESD protection, careful insertion, and correct fiber connection. Step 1: Prepare and Confirm InterfaceBefore installation, identify the optical module type (e.g., SFP, SFP+, SFP28) and the interface type (LC, SC, ST, FC) to ensure compatibility with the fiber connector and network device. Select the appropriate fiber type (single-mode or multi-mode) and length according to the module specifications.

Step 2: Safety and ESD PrecautionsOptical modules are electrostatic-sensitive components. Wear an ESD wrist strap or gloves and ensure proper grounding before handling the module. Avoid touching the edge connector or optical interface directly.

Keep dust plugs on idle ports to prevent contamination. Step 3: Inserting the Optical ModuleRemove the dust plug from the optical port. Insert the optical module smoothly into the slot with the printed side up and the pull tab or release handle facing outward.

Push gently until you hear a click, indicating the module is securely seated. If the module does not fit, do not force it; turn it over and try again. Verify installation by gently attempting to pull the module; it should remain locked in place.

Step 4: Connecting the FiberRemove the dust plug from the fiber connector. Connect the fiber cable to the module port, ensuring proper alignment and avoiding bending or stressing the fiber. Confirm that the fiber type and length meet the module specifications.

Avoid looking directly into the optical port, as laser radiation may be emitted. Step 5: VerificationAfter installation, check that the module is recognized by the device and that the link status is active. Measure input optical power if required to ensure it is within the normal range to prevent damage from overload.

Step 6: Removal (if needed)Disconnect the fiber cable. Press the release handle or bail latch and gently pull the module out. Replace dust plugs on both the module and the port to protect against contamination.

Following these steps ensures safe, reliable installation of Gigabit optical modules while maintaining network performance and protecting sensitive components.
