Grid-guided bridge

Overview

Grids can be made fully composite with supports and can accommodate complex deck geometry, cross-slopes and super-elevation. Speed of construction, high strength to weight ratio and excellent long term durability make these grid systems an excellent product choice. Prefabricated grid reinforced concrete and Exodermic® bridge decks help accelerate bridge construction using either cast-in-place or precast installation. These grid deck systems are also very lightweight and durable, often times weighing 30-50% less than conventional concrete decks and still. To set up a bridge analysis in GSA you will need the following data: Can be global, no need to define. Grid plane defines the geometry of a surface, while grid surface defines how loads will be applied to elements within a plane. MAURER dis-tinguishes between the fol in structure can be accommodated. Welded systems are also offered in two surface.
