# Fiber optic cable return figure-eight loop

## Overview

Figure 8 Method for Fiber Optic Installation | PDF This document provides instructions for using the "figure 8" technique when installing fiber optic cable.

## Key Takeaways

The figure-eight loop is a method of laying fiber optic cable to prevent twisting and kinking during installation. Purpose of the Figure-Eight LoopThe figure-eight loop is used when laying fiber optic cable on a surface during a pull. By forming the cable into a large "8" pattern, a half twist is introduced on one side and removed on the other, which prevents the cable from twisting or kinking during handling and pulling.

This technique is essential for maintaining the integrity of the optical fibers and ensuring reliable performance.

### Loop Size and Placement

The size of each loop is typically 6–12 feet (2–4 meters), depending on the cable's stiffness and diameter. The cable should be laid on a clean surface, often over a tarp or plastic sheet to prevent dirt contamination. Each loop should be slightly offset from the previous one to minimize mechanical pressure and avoid damage.

### Installation Procedure

Pull the cable out of the conduit or innerduct and lay it on the ground in a figure-8 pattern. Flip the cable so the end to be pulled next is on top, using several installers if necessary. Attach the cable end to the pull rope with appropriate swivel pulling eyes and continue the pull.

For midspan pulls, the cable reel is placed at the midpoint of a long span, and the cable is pulled to one end before laying the remaining cable in a figure-8 pattern on the ground. This eliminates the need to flip the cable over during the pull.

### Figure-8 Self-

### Supporting Cables

Some aerial fiber optic cables, such as Corning ALTOS® figure-8 cables, are designed with a figure-8 cross-section that incorporates a steel messenger and optical fiber core in a single jacket. This design allows: One-step installation using standard hardwareSelf-supporting aerial deployment without additional messenger wiresDurable and stable performance over a wide temperature rangeEasy midspan access due to the loose tube and SZ-stranded designBest PracticesPull the cable slowly and carefully to avoid kinks. Maintain the protective covering on reels until installation to prevent damage.

Ensure the loops are large enough to accommodate the cable's stiffness but not so large as to waste space or create tangles. Using the figure-eight loop method ensures that fiber optic cables remain untwisted, clean, and mechanically sound during installation, whether for surface pulls or aerial self-supporting deployments.

This document provides instructions for using the "figure 8" technique when installing fiber optic cable over long distances. It describes laying the cable in a large figure 8 pattern on the ground during

Figure-8 Fiber Optic Cable Installation

Figure-8 fiber optic cable installation refers to a specific method of aerial installation for fiber optic cables. In this installation technique, the fiber

Installation of Corning Optical Communications Self-Supporting

It incorporates both a steel messenger and the core of a standard optical fiber cable into a single jacket of figure-eight cross-section. The combination of strand and optical fiber into a single cable allows

Installing Fiber Optic Cable

When laying loops of fiber on a surface during a pull, use “figure-8” loops to prevent twisting the cable. The figure 8 puts a half twist in on one side of the 8 and takes it out on the other,
