How far can outdoor multimode optical cables transmit

Overview

Fiber optic cable can be run anywhere from 300 meters up to 80 kilometers (roughly 50 miles) depending on the cable type, transceiver used, and network standard. Multimode fiber optic cables are designed to carry multiple light modes simultaneously, each taking a different path or mode through the fiber. This characteristic makes MMF ideal for high-bandwidth applications over relatively short distances. However, the dispersion-compensating fibers can support more than 200 kilometers. For most enterprise or data center applications using multimode fiber, the practical limit sits between 300 m and 550 m. Single-mode. When planning fiber optic cabling, a common question arises: "How far can fiber optic cables transmit?

" Fiber optic transmission distance varies based on fiber type, environmental conditions, and equipment selection.
