Multimode single-port optical module

Overview

Multi-mode SFP optical modules are designed for short-distance data transmission within a network infrastructure. 5 microns, allowing multiple modes of light to propagate through the fiber. Each module type uses LC interfaces, and professionals commonly group them together under the name LC SFP modules. They mainly differ in the type of optical fiber they operate. Single-mode and multimode SFP modules will work differently based on the types of fiber cables they go with. Dual fiber modules use two fibers. Strategic deployment of SMF reduces 400G/800G signal integrity issues like TDECQ penalties compared. SFP (Small Form-factor Pluggable) is a compact, hot-pluggable network interface module used to connect network devices (switches, routers, firewalls) to fiber optic or copper cables.
