GPON user-side device loss

Overview

Troubleshooting is done using two main pieces of equipment (although, there are more solutions) - Optical Power Meters (OPMs) and Optical Time Domain Reflectometers (OTDR). OPM is constructed of a solid-state detector, signal conditioning circuit, and digital display. Cisco introduces GPON with the Catalyst GPON platform. The ODN is composed of passive optical components (POS), such as optical fibers, and one or more. If I am part of a GPON Network, every user connected to that line is time multiplexed and will use the same wavelength AFAIK. I was wondering, if now many households have FTTH, and someone would just shine light into their fiber at home, would the other households have issues with their network. A complete multi-vendor reference for GPON/EPON OLT configuration, monitoring & troubleshooting. It covers a relatively small geographical area and is designed to deliver services to home and office users, corporate customers, and. PON system might have different types of problems happening in different parts of network. Location of the problem defines whether all or just several subscribers will affected. Its single-fiber bidirectional transmission mechanism employs WDM, where downstream traffic adopts broadcast mode (1490nm wavelength), and upstream traffic uses TDMA.

GPON: Interference/Packet Loss possible through other users?

Combined with the difficulty of coupling ambient light onto singlemode fiber inadvertently and the comparatively strong transmitter, this scenario is unlikely to cause problems. Deliberately jamming
