Optical Port Router Optical Module

Overview

Cisco Routed Optical Networking Solution Guide, Release 3.0The Routed Optical Networking ML service connects two DWDM optical ports with a fixed bandwidth.

Key Takeaways

Yes, an optical module can be plugged into a router's compatible SFP or SFP+ port to enable fiber connectivity.

Compatibility and Port Types

Routers with SFP or SFP+ ports are designed to accept optical transceiver modules, which convert electrical signals to optical signals for fiber connections. These modules are hot-pluggable, meaning they can be inserted or removed while the router is powered on. Common module types include SFP, SFP+, SFP28, and QSFP, each supporting different speeds and fiber standards.

It is important to ensure the module matches the router's port type and the network speed requirements.

Practical Use

Optical modules are typically used for WAN uplinks or connecting to other network devices over fiber. For example, a router's SFP port can be used with an SFP module to connect directly to an ISP's fiber network, replacing a traditional fiber modem or ONT. Some routers feature combo ports that support either RJ-45 Ethernet or SFP modules, allowing flexibility in connection type.

Configuration Considerations

After inserting the optical module, the router may require configuration to assign the port as a WAN or LAN interface depending on your network setup. Compatibility with your ISP's equipment should be verified, as some ISPs restrict which SFP modules can be used on their network. Generally, any SFP module that meets industry standards and supports the required data rate (e.g., 1 Gbps or 10 Gbps) can be used.

Summary

Yes, optical modules can be plugged into routers with compatible SFP/SFP+ ports. Ensure the module type matches the port and network speed. Modules are hot-swappable and can be used for WAN or LAN fiber connections.

Verify IS

P compatibility and configure the router port appropriately for your network.
