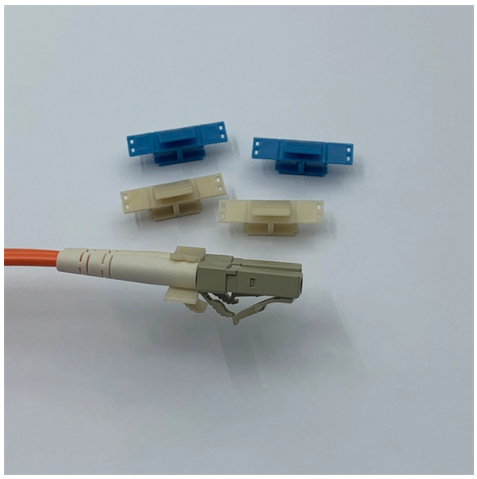
PoE switch connected to AP panel



Overview

the PoE switch is directly connected to the wireless AP and network camera that support PoE power supply through a network cable.

Key Takeaways

A PoE switch can power and connect AP panels using a single Ethernet cable per AP, ensuring both data and power delivery while simplifying network deployment.

Overview of Po

E Switch and AP Panel ConnectionA PoE (Power over Ethernet) switch integrates network switching and power delivery, allowing Ethernet cables to transmit both data and DC power to devices like wireless APs, IP cameras, or VoIP phones.

A

P panels, often used in office or enterprise environments, can be connected directly to PoE switch ports, enabling plug-and-play deployment without separate power lines.

Key Steps for Setup

Select the Correct PoE StandardIEEE 802. 3af: Provides up to 15. 4W per port.

IEE

E 802. 3at (PoE+): Provides up to 30W per port.

Ensure the A

P panel's power requirement matches the switch port's output.

Use Proper Cabling

Use 8-core Ethernet cables (Cat5e or higher) for simultaneous data and power transmission. High-quality, oxygen-free copper cables are recommended to reduce power loss and ensure stable connectivity.

IP Address and Network Configuration

Assign unique IP addresses to each AP panel to avoid conflicts.

Configure A

Ps in the same VLAN if they are part of the same network segment. For fat APs, initial configuration may require logging into the AP's management interface to set SSID, encryption, and IP settings.

Physical Connection

Connect the AP panel directly to a PoE-enabled port on the switch. For larger deployments, multiple APs can be connected to a PoE switch, which in turn connects to the core router or integrated AC controller.

Network Management

Managed Po

E switches allow centralized monitoring, port power prioritization, and cluster management, improving stability and troubleshooting. Ensure firmware of both APs and switches is up to date to prevent connectivity issues.

Troubleshooting Tips

If an AP shows “notconnect” status or fails to receive power, check: Port configuration and VLAN assignment. Cable quality and length (PoE typically supports up to 100 meters). Power budget of the switch to ensure sufficient wattage for all connected APs.

Some A

Ps may require a manual port speed adjustment (e.g., 10 Mbps/full duplex) to establish a stable link before returning to auto-negotiation. Avoid connecting non-PoE switches between the PoE switch and AP unless the switch supports PoE passthrough.

Advantages of Using Po

E Switches with AP PanelsSimplified wiring: Only one cable per AP is needed for both power and data. Flexible deployment: APs can be installed in ceilings or high walls without nearby power outlets. Improved stability: Reduces failure points compared to separate power and data lines.

Centralized management: Managed PoE switches allow monitoring and control of APs from a single interface. By following these guidelines, connecting a PoE switch to AP panels ensures reliable power delivery, stable network connectivity, and simplified deployment for enterprise or office wireless networks.
