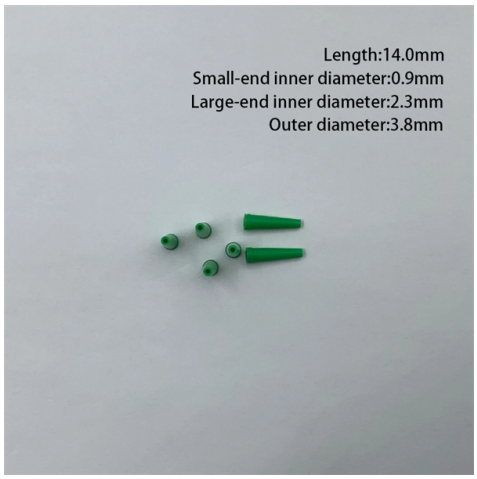
How to install an adjustable angle cable tray



Overview

The adjustable corner piece SRS is pushed inside the cable tray and attached with the included screw set. The range for adjustable corner piece SRS is 0-75°.

Key Takeaways

Adjustable angle cable trays are installed by cutting and aligning tray sections, using flexible splice plates, and securing them with proper supports while following safety and code requirements.

Tools and Preparation

To install adjustable angle cable trays, you will need basic tools such as a wrench, drill, and metal cutting tool. Begin by planning the layout according to the building design, cable routing requirements, and local electrical codes. Determine the desired angle for the tray change and mark the cutting lines on the tray sections, taking care to note rung locations if using ladder-type trays (Eaton).

Cutting and Fitting

Field cut the cable tray to match the required angle. Remove any rungs or sections that interfere with the cut. Ensure that the cut edges are smooth to prevent cable damage.

Flexible horizontal adjustable splice plates are then used to connect the cut sections, allowing for horizontal direction changes without requiring bonding jumpers. Splice plates should be installed with supports within 24 inches (600 mm) on both sides to maintain stability (Eaton).

Support and Alignment

Install the tray on trapeze or swing supports, threaded rods, or other approved mounting systems. Ensure that vertical hangers are properly positioned and that cross members are level. Use washers and hex nuts to allow for fine horizontal adjustments.

The tray clips can be installed inside or outside the tray depending on space and interference with rungs or connectors (Unitray). Proper alignment ensures that the tray can safely support cables and withstand mechanical loads.

Safety and Standards

Installation should be performed by qualified personnel familiar with electrical systems and safety procedures. Cable trays must comply with standards such as BS EN 61537 or NEMA VE2, depending on your region. Cable trays are designed to support cables, not to be used as walkways or for personnel support.

Ensure that all components are compatible and tested together as a system to maintain safety and reliability (BEAMA).

Final Checks

After installation, verify that all connections are secure, the tray is level, and the angle adjustments are correct. Check that there is sufficient clearance for cables and that the system can accommodate future cable additions. Proper documentation and adherence to manufacturer instructions will reduce installation errors and improve long-term performance.

By following these steps, adjustable angle cable trays can be installed safely, efficiently, and in compliance with industry standards, ensuring reliable cable support and routing.
