This article assesses the performance of time-based, frequency-based, and time-frequency-based digital protective relays, when operated at different sampling rates. Tested

Protection: Signal Acquisition

The sampling frequency is determined with the number of samples per cycle and the power frequency specified in the mask. The Figure 4-1 shows a signal sampled at a rate of 16 samples per cycle.

Low-sampling frequency two-terminal traveling wave-based overhead ...

Digital fault recorders (DFRs) and some conventional relays operate typically with sampling frequencies up to a few kHz. Conversely, traveling wave (TW)-based methods are usually

Using digital data from the unfiltered event report, which are not sampled at the protection and control processing rate of the relay, can produce a small timing error in Relay Word bits'' assertion time.

Basic protection relay knowledge

Definite time delay means that the protection operate time dose not change or depend on the fault type or the fault current magnitude. Inverse time delay, on the other hand, depends on the current

PROTECTIVE RELAY TESTING

A comprehensive testing program should simulate fault and normal operating conditions of the relay. Acceptance testing, commissioning, and startup will include control power tests, current transformer
