Lighting distribution boxes require jumper wires

Overview

Using approved bonding materials such as bonding straps, jumpers, locknuts, bushings, and wedges is essential to ensure reliable electrical connections. These materials must be compatible with the existing metal components and provide low-resistance pathways for fault currents. 15, a junction box is required whenever: You cannot: Common Misunderstanding If a cable passes through without splicing or terminating, you may not need to install a junction box — but you must still protect the conductors according to the wiring method rules. A junction box must be. This new technical paper by Andy Price, Bob LePage, David Cormier and Jim Rennick from Circuit Technology Center explores ten crucial guidelines for secure, organized, and industry-standard attachment and routing of jumper wires on circuit board assemblies, ensuring reliability and optimal. This paper defines ten essential rules for reliable jumper wire installation. Jumper wires play a critical. ecific guidelines when working with jumper wires. Main Panels and Distribution Boards In main service panels, the neutral is bonded to the equipment grounding conductors and the panel's metal. Switchboards and panelboards are often called “the guts” of a premises wiring system.
