Modify PoE switch

Overview

In the navigation pane, select PoE. The Edit PoE Details dialog box is displayed. The Cisco Universal Power Over Ethernet (UPOE) feature provides the capability to source up to 60 W of power (2 x 30 W) over both signal and spare pairs of the RJ-45 Ethernet cable by using the Layer 2 power negotiation protocols such as CDP or LLDP. These ports enable you to plug in devices that require both network connectivity and electric power, such as VoIP phones, wireless access points, and some IP. In the navigation pane, select PoE. Priority: The priority level—Critical, High, or Low. The initial allocation for Class 0, Class 3, and Class 4. PoE supports a full set of configuration and monitoring commands that allows you to configure, manage, and display PoE settings at the system, slot, and port level. To enable inline power, or PoE, you must have a powered switch.
