Nec cable tray spacing

Overview

Support spacing for cable trays must align with the manufacturer''s instructions, as outlined in NEC 392.30 (A).

Key Takeaways

Cable tray supports should generally be spaced 6 to 10 feet apart for standard trays, up to 20 feet for heavy-duty trays, with cable spacing and grouping following NEC 392 requirements.

Support Spacing

According to NEC 392. 30(A), standard cable trays require supports every 6 to 10 feet, while heavy-duty or long-span trays can be supported up to 20 feet apart depending on the manufacturer's load capacity chart and the total weight of the cables. Unsupported spans where cables transition to equipment or another raceway cannot exceed 6 feet; additional supports are required if this distance is exceeded to prevent mechanical stress.

For vertical or angled runs, cables should be fastened to transverse members, and horizontal runs may use ties to maintain spacing and improve heat dissipation. Cable Spacing and GroupingNEC 392. 80(A)(2)(c) specifies that adjacent cables of the same circuit must be spaced at least one cable diameter apart to maintain ampacity.

Single-conductor cables must be installed in circuit groups, keeping all conductors of a circuit together to prevent inductive heating of the tray. For larger cables (250 kcmil to 900 kcmil), a single layer is required, and spacing is generally dictated by tray width rather than individual cable separation. Smaller conductors (1/0 to 4/0 AWG) may be installed in single layers or grouped in circuits with ties at intervals not exceeding 18 inches.

Additional Considerations

Vertical clearance: NEC 2026 requires at least 12 inches of clear vertical space above trays for installation and maintenance. Thermal expansion: For long outdoor runs, expansion splice plates should be used to accommodate thermal movement. Cable ties: Use listed and approved ties for cable tray applications to meet fire-safety standards, especially in plenum spaces.

Tray fill: Ensure the sum of cable diameters does not exceed the tray width, and follow NEC fill limits (typically 40% for power cables, 50% for control/signal cables) to allow proper airflow and heat dissipation. By following these NEC guidelines, electrical installations can maintain mechanical stability, thermal safety, and code compliance.
