Power connection sequence for the three-level distribution box

Overview

Learn about the wiring process for a 3 phase distribution board (DB) box, including the necessary steps and safety precautions.

Key Takeaways

The correct connection sequence for a three-phase distribution box is Earth first, then Neutral, followed by the three phases (L1, L2, L3), following the FMLB principle for safety.

Step-by-

Step Connection Sequence

Earth Connection (E) Always connect the earth wire first. This ensures that the system is grounded before any live connections are made, providing a safe path for fault currents. In Powersafe systems, the Earth cover is opened first, and the earth connector is plugged into the designated socket ( ).

Neutral Connection (N) After the earth is secured, connect the neutral wire to the neutral busbar. If the distribution box has multiple neutral links, connect them together to ensure proper distribution to all circuits ( ). Phase Connections (L1, L2, L3) Connect the three-phase lines sequentially to their respective terminals.

Align the connectors properly and ensure they are fully seated and locked. This step completes the main power input to the distribution box ( ). Wiring Protective DevicesMCCB (Main Circuit Breaker): Connect the incoming three-phase supply to the MCCB input.

The MCC

B acts as the main switch and provides protection against overcurrent and short circuits ( ).

MC

Bs (Output Breakers): Connect the output of the MCCB to the input of the 3-pole MCBs for each load. Only line terminals pass through the MCBs, while neutral and earth are connected to their respective busbars ( ).

RCC

B (if used): Connect after the main MCCB to provide residual current protection, then distribute to output MCBs ( ).

Busbars and Links

Busbars: Use busbars to connect the MCCB to the output MCBs for high-current distribution. Avoid using normal wires for high-current connections ( ). Earth and Neutral Links: Ensure all earth and neutral links are interconnected to maintain proper grounding and neutral distribution ( ).

Safety PrinciplesFMLB (First Mate Last Break): The earth connection is made first and disconnected last to prevent electric shock ( ). Phase Identification: Clearly label L1, L2, L3, N, and E to avoid confusion during maintenance ( ). Mechanical Keying: Use keyed connectors where available to prevent incorrect connections ( ).

Following this sequence ensures safe, efficient, and code-compliant power distribution in a three-phase distribution box, minimizing the risk of electrical faults and hazards.
