Reserved length for starting distribution box

Overview

Standard requirements for the reserved size of distribution boxes. During wall construction, the reserved hole shall be about 20mm larger than the length.

Key Takeaways

The reserved hole for a distribution box should be about 20mm larger than the box's length and width, with depth equal to the box thickness plus plaster thickness.

Recommended Reserved Dimensions

When installing a distribution box in a wall, the reserved length and width of the hole should be approximately 20mm larger than the actual dimensions of the box to allow for proper fitting and adjustments during installation. The reserved depth should account for the thickness of the distribution box plus the plastering on the inner wall to ensure the box sits flush with the finished wall surface.

Installation Considerations

Alignment: The box should be installed firmly, both horizontally and vertically, with a vertical deviation not exceeding 3mm. Sealing: During concealed installation, there should be no gaps around the box. Edges should be close to the wall, and contact surfaces coated with anti-corrosion paint if necessary.

Fixing: If the box is embedded in masonry, it can be secured by filling concrete between the box and the wall. Airflow and Access: Leave sufficient space around the box for ventilation and future maintenance, which helps prevent overheating and allows easy access for wiring or inspections. Future Expansion: Consider leaving extra space (around 20–30% more than current requirements) to accommodate additional circuits or upgrades without costly modifications.

Summary

To ensure a safe, compliant, and maintainable installation, reserve a hole 20mm larger than the box dimensions in length and width, and set the depth to the box thickness plus plaster. Proper alignment, secure fixing, and adequate clearance for airflow and future expansion are essential for long-term reliability and safety.
