The core switch cannot support so many devices

Overview

But, that's only possible because core switches don't have to directly connect to very many devices. The argument against doing that, or the risk for doing that, host instability might impact the core switch. HTH. A core switch is not merely a type of switch but rather denotes the switch that operates at the core layer (the network's backbone). Positioned at the top of the three-layer network architecture, it functions like a senior management team in an organization, tasked primarily with efficiently. We have a pair of Dell N3224P-ON switches and today's morning my colleague gave me a task and instructions to remove some unused VLANs. I'm sure I removed the correct VLANs. When I saved the configuration, everything stopped working and now we don't know what to do. We already rebooted both. school with around 800 users having one core switch 6509-E sup-720 (inter-vlan routing) collapsed core design connected to - 30 layer 3 HP switches with 10G and 1G backup links - 2 juniper WLCs 120 APs and VMware servers looking for a solution to achieve core redundancy. First, fiber optic connections are more expensive, so cutting the number. When a switch fails, it's crucial to determine which layer of the OSI model the problem originates from to effectively troubleshoot and resolve the issue.
